VENTI-BOARD • VENTILATION

The Solution To Sick House Syndrome

Please allow us to introduce the all New Kil-N-Dri Ventiboard and Ventilation Concept.
Mold - Mildew & Dry Rot can be Controlled & Prevented

All current statistics point to the energy efficient home as being the #1 source of the "Sick House Syndrome". As members of the building and housing industry, you have probably encountered product failure caused by excessive moisture and poor ventilation. There are literally hundreds of combinations of problems that need to be handled by experts in the various fields and, in most cases ventilation and moisture control can play a key role in finding a cure for the majority of complaints. The solution encompasses the entire home, from the crawl space to the attic.

The majority of all homes, businesses and schools do not have adequate ventilation, no vapor barrier on the ground in the crawl space. Foundation vents are omitted or closed. Sidewall ventilation is nonexistent, soffit ventilation is restricted with insulation "plugging up" necessary outside fresh air to circulate or flow into the attic. Attic ventilation is simply allowing the tremendous volumes of heat to be exhausted to the outside, removing the mold-causing moisture from the insulation, ceiling tiles and the roof sheathing. Full vented ridges, gable vents, wind driven turbos and exhaust fans prevent moisture from accumulating and **mold cannot exist without moisture.**

We would like to invite you to visit our showrooms and learning center specifically designed with the latest technology of Cellulose and Spray Foam Insulation from inside & outside and from the crawl space to the attic behind plexiglass for easy viewing. The GEO Thermal Air Conditioning unit is in full operation for a cool & comfortable viewing of the Kil-N-Dri stucco wall.
